#### **NEW QUESTION: 1**

Click the exhibit button below. The service provider has both a VLL (epipe) service and a VPLS, as shown in the diagram below.

At router PE B, traffic arriving from both services will have

the same network-queue policy applied.

- A. TRUE
- B. FALSE

**Answer: B**

**NEW QUESTION: 2**

Which is NOT obtained from a product's Product Description?

- A. The quality method to be used
- B. The product's quality criteria
- C. The development method to be used
- D. Who will approve the product

**Answer: C**

**NEW QUESTION: 3**

You administer an online transaction processing (OLTP) system whose database is stored in Automatic Storage Management (ASM) and whose disk group use normal redundancy. One of the ASM disks goes offline, and is then dropped because it was not brought online before DISK\_REPAIR\_TIME elapsed.

When the disk is replaced and added back to the disk group, the ensuing rebalance operation is too slow.

Which two recommendations should you make to speed up the rebalance operation if this type of failure happens again?

- A. Set the DISK\_REPAIR\_TIME disk attribute to a lower value.
- B. Increase the value of the ASM\_POWER\_LIMIT parameter.
- C. Increase the number of ASMB processes.
- D. Increase the number of DBWR\_IO\_SLAVES in the ASM instance.
- E. Specify the statement that adds the disk back to the disk group.

**Answer: B,C**

Explanation:

A: ASM\_POWER\_LIMIT specifies the maximum power on an Automatic Storage Management instance for disk rebalancing. The higher the limit, the faster rebalancing will complete. Lower values will take longer, but consume fewer processing and I/O resources.

D:

\* Normally a separate process is fired up to do that rebalance. This will take a certain amount of time. If you want it to happen faster, fire up more processes. You tell ASM it can add more processes by increasing the rebalance power.

\* ASMB

ASM Background Process

Communicates with the ASM instance, managing storage and providing statistics

Incorrect:

Not B: A higher, not a lower, value of DISK\_REPAIR\_TIME would

be helpful here.

Not E: If you implement database writer I/O slaves by setting the DBWR\_IO\_SLAVES parameter, you configure a single (master) DBWR process that has slave processes that are subservient to it. In addition, I/O slaves can be used to "simulate" asynchronous I/O on platforms that do not support asynchronous I/O or implement it inefficiently. Database I/O slaves provide non-blocking, asynchronous requests to simulate asynchronous I/O.

#### NEW QUESTION: 4

- A. Option B
- B. Option D
- C. Option C
- D. Option A

**Answer: A**

Explanation:

Explanation

The types of private VLAN ports are as follows:

+ Promiscuous - The promiscuous port can communicate with all interfaces, including the community and isolated host ports, that belong to those secondary VLANs associated to the promiscuous port and associated with the primary VLAN

+ Isolated - This port has complete isolation from other ports within the same private VLAN domain, except that it can communicate with associated promiscuous ports.

+ Community -- A community port is a host port that belongs to a community secondary VLAN. Community ports communicate with other ports in the same community VLAN and with associated promiscuous ports.

These interfaces are isolated from all other interfaces in other communities and from all isolated ports within the private VLAN domain.
