#### **NEW QUESTION: 1**

Which of the following comes before Auto Scaling group creation?

- A. Creating the Auto Scaling launch config
- B. Creating the Auto Scaling policy
- C. Creating the Auto Scaling tags
- D. Creating the Auto Scaling instance

**Answer: A**

Explanation:

Explanation/Reference:

Explanation:

The Auto Scaling launch config is the first step that should be run before a user can create an Auto Scaling group. The launch config has all the information, such as the instance type, AMI ID, and other instance launch parameters. The Auto Scaling group uses this launch config to create a new group.

**NEW QUESTION: 2**

Which of the following security architecture elements also has sniffer functionality? (Choose two.)

- A. HSM
- B. IDS
- C. SSL accelerator
- D. WAP
- E. IPS

**Answer: B,E**

Explanation:

Explanation/Reference:

Explanation:

Sniffer functionality means the ability to capture and analyze the content of data packets as they are transmitted across the network.

IDS and IPS systems perform their functions by capturing and analyzing the content of data packets.

An intrusion detection system (IDS) is a device or software application that monitors network or system activities for malicious activities or policy violations and produces reports to a management station. IDS come in a variety of "flavors" and approach the goal of detecting suspicious traffic in different ways. There are network based (NIDS) and host based (HIDS) intrusion detection systems. Some systems may attempt to stop an intrusion attempt but this is neither required nor expected of a monitoring system. Intrusion detection and prevention systems (IDPS) are primarily focused on identifying possible incidents, logging information about them, and reporting attempts. In addition, organizations use IDPSes for other purposes, such as identifying problems with security policies, documenting existing threats and deterring individuals from violating security policies. IDPSes have become a necessary addition to the security infrastructure of nearly every organization.

IDPSes typically record information related to observed events, notify security administrators of important observed events and produce reports. Many IDPSes can also respond to a detected threat by attempting to prevent it from succeeding. They use several response techniques, which involve the IDPS stopping the attack itself, changing the security environment (e.g. reconfiguring a firewall) or changing the attack's content.
