Answer:

Explanation:

Explanation

Explanation

* Target 1: The element name is rate not Ratesheet.
The Xmlreader readToFollowing reads until the named element is found.

* Target 2:

The following example gets the value of the first attribute.

```
reader.ReadToFollowing("book");  
reader.MoveToFirstAttribute();  
string genre = reader.Value;  
Console.WriteLine("The genre value: " + genre);
```

* Target 3, Target 4:

The following example displays all attributes on the current node.

```
C#VB  
if (reader.HasAttributes) {  
Console.WriteLine("Attributes of &lt;" + reader.Name + "&gt;");  
while (reader.MoveToNextAttribute()) {  
Console.WriteLine(" {0}={1}", reader.Name, reader.Value);  
}  
// Move the reader back to the element node.  
reader.MoveToElement();  
}
```

The XmlReader.MoveToElement method moves to the element that contains the current attribute node.
