VM1 configuration. The VM is running Windows and is configured with a single network interface card (NIC) connected to the VNet. The IP address of the NIC is 10.0.0.1.

Network Watcher configuration. Network Watcher is enabled for the VNet. The configuration includes a connection monitor for the VNet and a packet capture session for the VNet.

Answer: B

Explanation:

Network Watcher Connection Monitor enables you to configure and track connection reachability, latency, and network topology changes. It helps reduce the amount of time to detect connectivity problems. The returned results can provide insights into whether a connectivity problem is due to a platform or a user configuration problem. This is not used in cases where we need to inspect for all the network traffic from one vm to another vm.

On the other hand Network Watcher packet capture allows you to create capture sessions to track traffic to and from a virtual machine. So in this scenario we need to use Network Watcher packet capture
