**NEW QUESTION: 1**

When comparing Cisco Nexus 2000 Series Fabric Extenders to traditional top-of-rack switches, which two statements are true? (Choose two.)

- A. Management functions are performed on the Fabric Extender.
- B. Fabric Extenders offload the switching of traffic from the parent.
- C. Fabric Extenders operate as a remote line card to the upstream switch.
- D. Fabric Extenders lower oversubscription in the data center.
- E. Physical interfaces are represented by the parent switch as logical interfaces.

**Answer: C,E**

**NEW QUESTION: 2**

You use the `Task.Run()` method to launch a long-running data processing operation. The data processing operation often fails in times of heavy network congestion.

If the data processing operation fails, a second operation must clean up any results of the first operation.

You need to ensure that the second operation is invoked only if the data processing operation throws an unhandled exception.

What should you do?

- A. Use the `TaskScheduler` class to create a task and call the `TryExecuteTask()` method on the class.
- B. Create a task by calling the `Task.ContinueWith()` method.
- C. Create a task within the operation, and set the `Task.StartOnError` property to true.
- D. Create a `TaskFactory` object and call the `ContinueWhenAll()` method of the object.

**Answer: B**

Explanation:

`Task.ContinueWith` - Creates a continuation that executes asynchronously when the target `Task` completes. The returned `Task` will not be scheduled for execution until the current task has completed, whether it completes due to running to completion successfully, faulting due to an unhandled exception, or exiting out early due to being canceled.

**NEW QUESTION: 3**

What does compute instance vertical scaling mean?

- A. Adding additional compute instances
- B. Enabling Disaster recovery
- C. Providing Fault tolerance
- D. Changing to a large or smaller shape

**Answer: D**

Explanation:

## Explanation

### Changing the Shape of an Instance (Horizontal Scaling)

You can change the shape of a virtual machine (VM) instance without having to rebuild your instances or redeploy your applications. This lets you scale up your Compute resources for increased performance, or scale down to reduce cost.

### Autoscaling (vertical scaling)

Autoscaling lets you automatically adjust the number of Compute instances in an instance pool based on performance metrics such as CPU utilization. This helps you provide consistent performance for your end users during periods of high demand, and helps you reduce your costs during periods of low demand. As load increases, instances are automatically provisioned: the instance pool scales out. As load decreases, instances are automatically removed: the instance pool scales in.
