**NEW QUESTION: 2**

Your company has complex consolidation requirements with multiple general ledger instances. You are using Oracle Hyperion Financial Management to consolidate the disparate General Ledgers. You can typically map segments between your general ledger segment to a Hyperion Financial Management segment, such as Company to Entity, Department to Department, and Account to Account.

What happens to segments in your source general ledger, such as Program, that cannot be mapped Hyperion Financial Management?

- A. No data is transferred.
- B. Data is summarized across segments that are not mapped to Hyperion Financial Management
- C. The unmapped segments default to future use segments in Hyperion Financial Management
- D. Errors occur for unmapped segments. You must map multiple segments from source general ledgers to the target segment in Hyperion Financial Management.

**Answer: D**

**NEW QUESTION: 3**

A company has developed a web application that runs on Amazon EC2 instances in one AWS Region. The company has taken on new business in other countries and must deploy its application

into other to meet low-latency requirements for its users. The regions can be segregated, and an application running in one region does not need to communicate with instances in other regions.

How should the company's Solutions Architect automate the deployment of the application so that it can be MOST efficiently deployed into multiple regions?

**A.** Write a CloudFormation template describing the application's infrastructure in the Resources section.

Use a CloudFormation stack set from an administrator account to launch stack instances that deploy the application to other regions.

**B.** Write a bash script that uses the AWS CLI to query the current state in one region and output a JSON representation. Pass the JSON representation to the AWS CLI, specifying the --region parameter to deploy the application to other regions.

**C.** Write a CloudFormation template describing the application's infrastructure in the resources section.

Create a CloudFormation stack from the template by using the AWS CLI, specify multiple regions using the --regions parameter to deploy the application.

**D.** Write a bash script that uses the AWS CLI to query the current state in one region and output an AWS CloudFormation template. Create a CloudFormation stack from the template by using the AWS CLI, specifying the --region parameter to deploy the application to other regions.

**Answer: A**

Explanation:

Explanation

A stack set lets you create stacks in AWS accounts across regions by using a single AWS CloudFormation template. All the resources included in each stack are defined by the stack set's AWS CloudFormation template. As you create the stack set, you specify the template to use, as well as any parameters and capabilities that template requires.
