Answer: B

NEW QUESTION: 2

Your network contains an Active Directory domain. The domain contains a site named Site1.

All of the client computers in Site1 use static IPv4 addresses on a single subnet. Site1 contains a Storage Area Network (SAN) device and two servers named Server1 and Server2 that run Windows Server 2012.

You plan to implement a DHCP infrastructure that will contain Server1 and Server2. The infrastructure will contain several IP address reservations. You need to recommend a solution for the DHCP infrastructure to ensure that clients can receive IP addresses from a DHCP server if either Server1 or Server2 fails.

What should you recommend? (Each correct answer is a complete solution. Choose all that apply.)

- A. Configure a DHCP failover relationship that contains Server1 and Server2.
- B. Configure all of the client computers to use IPv6 addresses, and then configure Server1 and Server2 to run DHCP in stateless mode.
- C. Create a scope for each server, and then configure each scope to contain half of the IP addresses.
- D. Configure Server1 and Server2 as members of a failover cluster, and then configure DHCP as a clustered resource.

Answer: A,C,D

NEW QUESTION: 3

A new customer at your Retail Pharmacy has brought in a script for:

Percocet 2.5mg 1-2 tab Q4.

Which of the following information is NOT required on the prescription label?

- A. Prescribing Doctors DEA number
- B. Patients Name
- C. Prescription Number
- D. Filling pharmacists name

Answer: A

NEW QUESTION: 4

R1 router clock is synchronized with ISP router. R2 is supposed to receive NTP updates from R1. But you observe that R2 clock is not synchronized with R1. What is the reason R2 is not receiving NTP updates from R1?

- A. R1 router Ethernet interface that is connected to R2 is placed in shutdown condition.
- B. The IP address that is used in the NTP configuration on R2 router is incorrect.
- C. The NTP server command not configured on R2 router.
- D. R2 router Ethernet interface that is connected to R1 is placed in shutdown condition.

Answer: B

Explanation:

Explanation/Reference:

Explanation:

First we should verify if the ports connected between R1 and R2 is in "up/up" state with the "show ip interface brief" command on R1 & R2.

Note: We learn R1 & R2 connect to each other via E0/2 interface because the IP addresses of these interfaces belong

to 192.168.10.0/30 subnet. Both of them are "up/up" so the link connecting between R1 & R2 is good.

Next we need to verify the ntp configuration on R2 with the "show running-config" command:

So there is only one command related to NTP configuration on R2 so we need to check if the IP address of 192.168.100.1 is correct or not. But from the "show ip interface brief" command on R1 we don't see this IP -> This IP address is not correct. It should be 192.168.10.1 (IP address of interface E0/2 of R1), not 192.168.100.1.
