Global customers place orders from several countries. You need to view the country from which each customer has placed the most orders. Which Transact-SQL query do you use?

**A.** `SELECT c.CustomerID, c.CustomerName, o.ShippingCountry FROM Customer c INNER JOIN`

`(SELECT CustomerID, ShippingCountry, RANK() OVER (PARTITION BY CustomerID ORDER BY OrderAmount DESC) AS Rnk`

`FROM Orders`

`GROUP BY CustomerID, ShippingCountry) AS o`

`ON c.CustomerID = o.CustomerID`

`WHERE o.Rnk = 1`

**B.** `SELECT c.CustomerID, c.CustomerName, o.ShippingCountry FROM (SELECT c.CustomerID, c.CustomerName, o.ShippingCountry, RANK()`

`OVER (PARTITION BY CustomerID`

`ORDER BY COUNT(o.OrderAmount) ASC) AS Rnk`

`FROM Customer c`

```

INNER JOIN Orders o
ON c.CustomerID = o.CustomerID
GROUP BY c.CustomerID, c.CustomerName, o.ShippingCountry) cs
WHERE Rnk = 1

**NEW QUESTION: 4**

The marketing department of a company is deciding on the price to charge for a key product. In setting this price, marketing needs to consider the price that a major competitor will charge for a similar product because the competitor's price will

affect the demand for the company's product. Similarly, in setting its price, the competitor will consider what the company will charge. What is an appropriate mathematical technique for analyzing such a decision?

- A. Linear programming.
- B. Game theory.
- C. Probability theory.
- D. Sensitivity analysis.

**Answer: B**

Explanation:

Game (or decision) theory is a mathematical approach to decision making when confronted with an enemy or competitor. Games are classified according to the number of players and the algebraic sum of the payoffs. In a two-person game, if the payoff is given by the loser to the winner, the algebraic sum is zero and the game is called a zero-sum game. If it is possible for both players to profit, however, the game is a positive-sum game. Mathematical models have been developed to select optimal strategies for certain simple games.
