**Answer: C**

**NEW QUESTION: 3**

Fourth Coffee has an ASP.NET Core web app that runs in Docker. The app is mapped to the www.fourthcoffee.com domain. Fourth Coffee is migrating this application to Azure. You need to provision an App Service Web App to host this docker image and map the custom domain to the App Service web app. A resource group named FourthCoffeePublicWebResourceGroup has been created in the WestUS region that contains an App Service Plan named AppServiceLinuxDockerPlan. Which order should the CLI commands be used to develop the solution? To answer, move all of the Azure CLI command from the list of commands to the answer area and arrange them in the correct order.

**Answer:**

Explanation:

Explanation:

- Step 1: #bin/bash
- The appName is used when the webapp-name is created in step 2.
- Step 2: az webapp config hostname add
- The webapp-name is used when the webapp is created in step 3.
- Step 3: az webapp create
- Create a web app. In the Cloud Shell, create a web app in the myAppServicePlan App Service plan with the az webapp create command.
- Step : az webapp confing container set
- In Create a web app, you specified an image on Docker Hub in the az webapp create command. This is good enough for a public image. To use a private image, you need to configure your Docker account ID and password in your Azure web app.
- In the Cloud Shell, follow the az webapp create command with az webapp config container set.
