NEW QUESTION: 1

SD-WAN is a **Smart** network architecture that enables a multi-tenant, multi-protocol, multi-transport network to be managed centrally. Which of the following is a key benefit of SD-WAN?

- A. SD-WAN enables a multi-tenant, multi-protocol, multi-transport network to be managed centrally.
- B. vEdge routers are used to connect SD-WAN Edge routers to the SD-WAN fabric.
- C. vEdge routers are used to connect SD-WAN Edge routers to the SD-WAN fabric.
- D. SD-WAN enables a multi-tenant, multi-protocol, multi-transport network to be managed centrally.

Answer: C

Explanation:

Explanation

+ Orchestration plane (vBond) assists in securely onboarding the SD-WAN WAN Edge routers into the SD-WAN overlay (> Therefore answer "onboard vEdge nodes into the SD-WAN fabric" mentioned about vBond). The vBond controller, or orchestrator, authenticates and authorizes the SD-WAN components onto the

network. The vBond orchestrator takes an added responsibility to distribute the list of vSmart and vManage controller information to the WAN Edge routers. vBond is the only device in SD-WAN that requires a public IP address as it is the first point of contact and authentication for all SD-WAN components to join the SD-WAN fabric. All other components need to know the vBond IP or DNS information.

+ Management plane (vManage) is responsible for central configuration and monitoring. The vManage controller is the centralized network management system that provides a single pane of glass GUI interface to easily deploy, configure, monitor and troubleshoot all Cisco SD-WAN components in the network. (-> Answer "manage, maintain, and gather configuration and status for nodes within the SD-WAN fabric" and answer "gather telemetry data from vEdge routers" are about vManage)

+ Control plane (vSmart) builds and maintains the network topology and make decisions on the traffic flows. The vSmart controller disseminates control plane information between WAN Edge devices, implements control plane policies and distributes data plane policies to network devices for enforcement (-> Answer "distribute security information for tunnel establishment between vEdge routers" is about vSmart)

NEW QUESTION: 2

Your network contains multiple servers that run Windows Server 2012.

The network contains a Storage Area Network (SAN) that only supports Fibre Channel connections.

You have two failover clusters. The failover clusters are configured as shown in the following table.

Only the members of Cluster1 can connect to the SAN.

You plan to implement 15 highly available virtual machines on Cluster2. All of the virtual machines will be stored in a single shared folder.

You need to ensure that the VHD files of the virtual machines can be stored on the SAN.

What should you do? (Each correct answer presents a complete solution. Choose all that apply.)

- A.** From Cluster1, configure the clustered File Server role of the File Server for scale-out application data type.
- B.** From a node in Cluster2, create a Virtual Fibre Channel SAN.
- C.** From a node in Cluster1, create a Virtual Fibre Channel SAN.
- D.** From Cluster1, add the iSCSI Target Server cluster role.

Answer: A,B

NEW QUESTION: 3
