You plan to deploy multiple instances of an Azure web app across several Azure regions.

You need to design an access solution for the app. The solution must meet the following replication requirements:

Support rate limiting.

Balance requests between all instances.

Ensure that users can access the app in the event of a regional outage.

Solution: You use Azure Load Balancer to provide access to the app.

Does this meet the goal?

- A. No
- B. Yes

Explanation

Load Balancer distributes inbound flows that arrive at the load balancer's front end to backend pool instances but it does not provide high availability at the regional level.

NEW QUESTION: 3

Refer to the exhibit.

Which EtherChannel negotiation protocol is configured on the interface f0/13 f0/15?

- A. Port Aggregation Protocol
- B. Link Combination Control Protocol
- C. Link Aggregation Control Protocol
- D. Port Combination Protocol

Answer: A

Explanation:

Explanation/Reference:

Explanation:

PAgP modes are off, auto, desirable, and on. Only the combinations auto-desirable, desirable-desirable, and on-on will allow a channel to be formed. .

1. on: PAgP will not run. The channel is forced to come up.

2. off: PAgP will not run. The channel is forced to remain down.

3. auto: PAgP is running passively. The formation of a channel is desired; however, it is not initiated.

4. desirable: PAgP is running actively. The formation of a channel is desired and initiated.

The Link Aggregate Control Protocol (LACP) trunking supports four modes of operation:

On: The link aggregation is forced to be formed without any LACP negotiation .In other words, the

switch neither sends the LACP packet nor processes any inbound LACP packet. This is similar to the on state for PAgP.

Off: The link aggregation is not formed. We do not send or understand the LACP packet.

This is similar to the off state for PAgP.

Passive: The switch does not initiate the channel but does understand inbound LACP packets. The

peer (in active state) initiates negotiation (when it sends out an LACP packet) which we receive and answer, eventually to form the aggregation channel with the peer. This is similar to the auto mode in PAgP.

Active: We can form an aggregate link and initiate the negotiation. The link aggregate is formed if the

other end runs in LACP active or passive mode. This is similar to the desirable mode of PAgP.

In this example, we see that fa 0/13, fa0/14, and fa0/15 are all in Port Channel 12, which is operating in desirable mode, which is only a PAgP mode.
