NEW QUESTION: 1

```
-- Exhibit -  
policy-options { policy-statement accept-static { from protocol  
static; then accept; }  
} -- Exhibit -
```

Click the Exhibit button.

The policy shown in the exhibit is deployed on a router and used as the only BGP export policy. The router is sending only one BGP route to its peers. However, when you run the CLI command `test policy accept-static 0.0.0.0/0`, the policy matches thousands of routes.

Which statement explains this discrepancy?

- A.** The default policy for the test policy command is to accept all routes.
- B.** The test policy command always shows all routes, regardless of whether they match the policy, when you use the `0.0.0.0/0` argument.
- C.** The default policy for BGP is to reject all routes.

D. All policies have an implicit then accept final term.

Answer: A

NEW QUESTION: 4

How many Threads are created when passing task to an Executor instance?

- A. A number of Threads equal to the number of CPUs Is used to execute tasks.
- B. A developer-defined number of Threads is used to execute tasks.
- C. A new Thread is used for each task.
- D. A number of Threads determined by system load is used to execute tasks.
- E. A single Thread Is used to execute all tasks.
- F. The method used to obtain the Executor determines how many

Threads are used to execute tasks.

Answer: F

Explanation:

The Executor interface provides a single method, `execute`, designed to be a drop-in replacement for a common thread-creation idiom. If `r` is a `Runnable` object, and `e` is an `Executor` object you can replace `(new Thread(r)).start();` with `e.execute(r);` However, the definition of `execute` is less specific. The low-level idiom creates a new thread and launches it immediately. Depending on the `Executor` implementation, `execute` may do the same thing, but is more likely to use an existing worker thread to run `r`, or to place `r` in a queue to wait for a worker thread to become available.
