#### **NEW QUESTION: 1**

Your network contains two servers named Server1 and Server2 that run windows Server 2012 R2. Server1 and Server2 have the Windows Server Update Services server role installed.

Server1 synchronizes from Microsoft Update. Server2 is a Windows Server Update Services (WSUS) replica of Server1.

You need to configure replica downstream servers to send Server1 summary information about the computer update status.

What should you do?

- A. From Server2, configure Reporting Rollup.
- B. From Server1, configure Reporting Rollup.

- C. From Server2, configure Email Notifications.
- D. From Server1, configure Email Notifications.

**Answer: B**

Explanation:

WSUS Reporting Rollup Sample Tool This tool uses the WSUS application programming interface (API) to demonstrate centralized monitoring and reporting for WSUS. It creates a single report of update and computer status from the WSUS servers into your WSUS environment. The sample package also contains sample source files to customize or extend the tool functionality of the tool to meet specific needs. The WSUS Reporting Rollup Sample Tool and files are provided AS IS. No product support is available for this tool or sample files. For more information read the readme file.

### **NEW QUESTION: 2**

A 16-node vSAN cluster has been deployed in a primary data center. All virtual machines are assigned a storage policy containing the rule Primary level of failures to tolerate = 1. A storage controller in one of the nodes produces several errors and eventually suffers a permanent failure.

How does vSAN handle this issue?

- A. All components on the drives attached to the failed storage controller are marked "Absent". vSAN starts rebuilding the affected components on other healthy drives in the vSAN cluster after the affected host is put into maintenance mode.
- B. All components on the drives attached to the failed storage controller are marked "Degraded". vSAN immediately starts rebuilding the affected components on other healthy drives in the vSAN cluster.
- C. All components on the drives attached to the failed storage controller are marked "Stale". vSAN starts rebuilding the affected components on other healthy drives in the vSAN cluster after 60 minutes have elapsed.
- D. All components on the drives attached to the failed storage controller are marked "Stale". An administrator must log into the vSphere Web Client and click the Repair Objects Immediately button to restore redundancy.

**Answer: B**

### **NEW QUESTION: 3**

Your company deploys several Linux and Windows virtual machines (VMs) to Azure. The VMs are deployed with the Microsoft Dependency Agent and the Log Analytics Agent installed by using Azure VM extensions.

On-premises connectivity has been enabled by using Azure ExpressRoute.

You need to design a solution to monitor the VMs.

Which Azure monitoring services should you use? To answer, select the appropriate Azure monitoring services in the answer area.

NOTE: Each correct selection is worth one point.

**Answer:**

Explanation:

Explanation

Box 1: Azure Traffic Analytics

Traffic Analytics is a cloud-based solution that provides visibility into user and application activity in cloud networks. Traffic analytics analyzes Network Watcher network security group (NSG) flow logs to provide insights into traffic flow in your Azure cloud. With traffic analytics, you can:

- \* Identify security threats to, and secure your network, with information such as open-ports, applications attempting internet access, and virtual machines (VM) connecting to rogue networks.
- \* Visualize network activity across your Azure subscriptions and identify hot spots.
- \* Understand traffic flow patterns across Azure regions and the internet to optimize your network deployment for performance and capacity.
- \* Pinpoint network misconfigurations leading to failed connections in your network.

Box 2: Azure Service Map

Service Map automatically discovers application components on Windows and Linux systems and maps the communication between services. With Service Map, you can view your servers in the way that you think of them: as interconnected systems that deliver critical services. Service Map shows connections between servers, processes, inbound and outbound connection latency, and ports across any TCP-connected architecture, with no configuration required other than the installation of an agent.
