**NEW QUESTION: 2**

A company has 10 portable client computers that run Windows 8.1.

The portable client computers have the network connections described in the following table.

None of the computers can discover other computers or devices, regardless of which connection they use.

You need to configure the connections so that the computers can discover other computers or devices only while connected to the CorpWired or CorpWifi connections.

What should you do on the client computers?

- A. For the CorpWired connection, select yes, turn on sharing and connect to devices.
- B. Turn on network discovery for the Public profile.
- C. Change the CorpWired connection to public. Turn on network discovery for the Public profile. For the HotSpot connection, select No, don't turn on sharing or connect to devices.
- D. For the CorpWifi connection, select yes, turn on sharing and connect to devices.
- E. Turn on network discovery for the Private profile.

**Answer: C**

Explanation:

The CorpWifi and HotSpot connections are already set properly.

The private

profile has network discovery enabled by default. So we need to deal with the CorpWired

without breaking anything else.

CorpWired connection is already public so it doesn't make sense to set it again to public.

Also, enabling network discovery for the Public profile is a dangerous practice.

Ideally it would be to set the CorpWired connection to private.

However, since this is not

one of the available options, turning on sharing basically does the same thing.

Simple Questions: What are Network Locations in Windows 7 & Windows 8?

Network Locations in Windows 8: Private vs Public

Windows 8 further simplifies the concept of network locations, reducing them to only two

choices:

Private network - This profile should be applied to your home network or to the network

from your workplace. When this profile is assigned to a network connection, network

discovery is turned on, file and printer sharing are turned on and homegroup connections

are allowed.

Public network - This profile is also named Guest. It is the more secure of the two because

network discovery is turned off as well as file and printer sharing. This profile should be

used when connecting to public networks you don't trust, like those found in airports, coffee

shops, bars, hotels, etc.

There's also a third network location profile named Domain network. This one cannot be

set by a normal user. It is available for enterprise workplaces and it is set by the network

administrator. The settings applied to this profile are those set by your company and you

cannot change them.

## How to Change a Network Location in Windows 8

Let's get back to the Networks list: right click or press and hold your active network connection. A menu is displayed with several options, depending on the network type.

Click or tap "Turn sharing on or off" (the only option common to both wired and wireless networks). For wired networks you will see less options being displayed in the contextual menu. You are asked if you want to turn on sharing between PCs and connect to devices on this network.

Selecting "No, don't turn on sharing or connect to devices" is the equivalent of applying the Public profile. Selecting "Yes, turn on sharing and connect to devices" is the equivalent of applying the Private profile. Make your choice and the appropriate settings are applied.
