**Answer: D**

Explanation:  
Explanation

If the class that wraps the external resource is shareable and thread-safe, create a shared singleton instance or a pool of reusable instances of the class. The following example uses a static HttpClient instance, thus sharing the connection across all requests.

```
public class SingleHttpClientInstanceController : ApiController
{
    private static readonly HttpClient httpClient;
    static SingleHttpClientInstanceController()
    {
```

```
httpClient = new HttpClient();
}
// This method uses the shared instance of HttpClient for every
call to GetProductAsync.
public async Task<Product> GetProductAsync(string id)
{
var hostName = HttpContext.Current.Request.Url.Host;
var result = await
httpClient.GetStringAsync(string.Format("http://{0}:8080/api/..
.", hostName));
return new Product { Name = result };
}
}
```
