- C.** Mutually exclusive source servers that may not map to the same destination server may be defined based on nodes of a Real Application Cluster (RAC) database.

Answer: B,C

NEW QUESTION: 2

A packaged goods company is migrating its current site to AEM. The company has a presence in the US, but is expanding into two other countries within 12 months of launch on AEM. During which two tasks should the architect consider this expansion goal? (Choose two.)

- A. Component development
- B. Content migration
- C. Site hierarchy definition
- D. Workflow implementation

Answer: A, B

NEW QUESTION: 3

Azure is migrating its current site to AEM. The company has a presence in the US, but is expanding into two other countries within 12 months of launch on AEM. During which two tasks should the architect consider this expansion goal? (Choose two.)

- A. Component development
- B. Content migration
- C. Site hierarchy definition
- D. Workflow implementation

Answer: D

Explanation:

Microsoft SQL Server Always On Availability Groups. Microsoft SQL Server Always On Availability Groups (AGs) are a high-availability and disaster-recovery solution for Microsoft SQL Server. They allow you to create a primary replica and one or more secondary replicas on different servers. The primary replica handles all the work, and the secondary replicas are kept in sync with the primary replica. In the event of a failure, the secondary replica can take over as the primary replica. This ensures that your data is always available and that your application can continue to run without interruption. For more information, see the Microsoft documentation on Always On Availability Groups.
