### NEW QUESTION: 1

Which of the following describes a proactive trigger for problem management?

- A. identity NAT
- B. dynamic NAT
- C. static NAT
- D. dynamic PAT

**Answer: B,C**

Explanation:

Adding Network Objects for Mapped Addresses

For dynamic NAT, you must use an object or group for the mapped addresses. Other NAT types have the option of using inline addresses, or you can create an object or group according to this section.

\* Dynamic NAT:

+ You cannot use an inline address; you must configure a network object or group.

+ The object or group cannot contain a subnet; the object must define a range; the group can include hosts and ranges.

+ If a mapped network object contains both ranges and host IP addresses, then the ranges are used for dynamic NAT, and then the host IP addresses are used as a PAT fallback.

\* Dynamic PAT (Hide):

+ Instead of using an object, you can optionally configure an inline host address or specify the interface address.

+ If you use an object, the object or group cannot contain a subnet; the object must define a host, or for a PAT pool, a range; the group (for a PAT pool) can include hosts and ranges.

\* Static NAT or Static NAT with port translation:

+ Instead of using an object, you can configure an inline address or specify the interface address (for static NAT-with-port-translation).

+ If you use an object, the object or group can contain a host, range, or subnet.

\* Identity NAT

+ Instead of using an object, you can configure an inline address.

+ If you use an object, the object must match the real addresses you want to translate.

### NEW QUESTION: 2

Which describes a proactive trigger for problem management?

- A. Automated detection of an infrastructure or application fault, using event/alert tools automatically to raise an incident
- B. Analysis of an incident by a technical support group which

reveals that an underlying problem exists, or is likely to exist

C. Suspicion or detection of a cause of one or more incidents by the service desk

D. Trending of historical incident records to identify one or more underlying causes

**Answer: D**

**NEW QUESTION: 3**

The Diffie-Hellman algorithm is used for:

A. Digital signature

B. Encryption

C. Non-repudiation

D. Key agreement

**Answer: D**

Explanation:

Explanation/Reference:

The Diffie-Hellman algorithm is used for Key agreement (key distribution) and cannot be used to encrypt and decrypt messages.
