NEW QUESTION: 1

Which two statements about Cisco ASA failover troubleshooting are true? (Choose two.)

- A.** With active/active failover, failover link troubleshooting should be done in the system execution space.
- B.** With active/active failover, ASR groups must be enabled.
- C.** Syslog level 1 messages will be generated on the standby unit only if the logging standby command is used.
- D.** With active/active failover, user data passing interfaces troubleshooting should be done within the context execution space.
- E.** The failed interface threshold is set to 1. Using the show monitor-interface command, if one of the monitored interfaces on both the primary and secondary Cisco ASA appliances is in the unknown state, a failover should occur.

Answer: A,D

Explanation:

System Configuration The system administrator adds and manages contexts by configuring each context configuration location, allocated interfaces, and other context operating parameters in the system configuration, which, like a singlemode configuration, is the startup configuration. The system configuration identifies basic settings for thesecurity

name, and description.

1. Set the evolve task parameters.

SET_EVOLVE_TASK_PARAMETER

This function updates the value of an evolve task parameter. In this release, the only valid parameter is TIME_LIMIT.

4. Execute the evolve task by using the

DBMS_SPM.EXECUTE_EVOLVE_TASK function. This function executes an evolution task. The input parameters can be the task name, execution name, and execution description. If not specified, the advisor generates the name, which is returned by the function.

3: IMPLEMENT_EVOLVE_TASK

This function implements all recommendations for an evolve task. Essentially, this function is equivalent to using ACCEPT_SQL_PLAN_BASELINE for all recommended plans. Input parameters include task name, plan name, owner name, and execution name.

5. Report the task outcome by using the DBMS_SPM_EVOLVE_TASK function. This function displays the results of an evolve task as a CLOB. Input parameters include the task name and section of the report to include.

NEW QUESTION: 3

An organization is using cost allocation tags to find the cost distribution of different departments and projects. One of the instances has two separate tags with the key/ value as "InstanceName/HR",

"CostCenter/HR". What will AWS do in this case?

A. AWS will allow tags but will not show correctly in the cost allocation report due to the same value of the two separate keys

B. InstanceName is a reserved tag for AWS. Thus, AWS will not allow this tag

C. AWS will allow both the tags and show properly in the cost distribution report

D. AWS will not allow the tags as the value is the same for different keys

Answer: C

Explanation:

AWS provides cost allocation tags to categorize and track the AWS costs. When the user applies tags to his AWS resources, AWS generates a cost allocation report as a comma-separated value (CSV file) with

the usage and costs aggregated by those tags. Each tag will have a key-value and can be applied to

services, such as EC2, S3, RDS, EMR, etc. It is required that the key should be different for each tag. The

value can be the same for different keys. In this case since the value is different, AWS will properly show

the distribution report with the correct values.
