NEW QUESTION: 1

Which two statements about the Cisco ACI Layer 4 to Layer 7 service integration are true? (Choose two.)

- A.** When an endpoint detaches from the Cisco ACI fabric, the Cisco APIC cannot notify the Layer 4 to Layer 7 service to dynamically remove configuration.
- B.** Cisco ACI fabric cannot detect when a server detaches from the network.
- C.** When a new endpoint attaches to the Cisco ACI fabric, the

Cisco APIC can notify the Layer 4 to Layer 7 service to dynamically add additional configuration.

D. Cisco ACI fabric cannot detect when a new server attaches to the network.

E. When a new endpoint attaches to the Cisco ACI fabric, the Cisco APIC cannot notify the Layer 4 to Layer 7 service to dynamically add additional configuration.

F. When an endpoint detaches from the Cisco ACI fabric, the Cisco APIC can notify the Layer 4 to Layer 7 service to dynamically remove configuration.

Answer: C,F

Explanation:

Endpoint and Network Event APIs The following APIs are called when an endpoint or a network configuration changes for endpoint groups (EPGs) that are associated with the graph:

```
def attachEndpoint( device, configuration, endpoints ) def
detachEndpoint( device, configuration, endpoints ) def
attachNetwork( device, configuration, networks) def
detachNetwork( device, configuration, networks )
```

These APIs are called only if the device specification supports an endpoint or network attach notification and you have enabled a notification on the function connector. The AttachEndpoint and DetachEndpoint events are called when an endpoint within an EPG attaches or detaches. The network APIs are called when you modify the subnet configuration under the bridge domain or EPG. These APIs provide information to enable the automation of any service function configuration that should be modified on an endpoint or network configuration change. An example would be if you dynamically add and remove a server from a pool that is attached to a load balancer or dynamically update a subnet within an access list defined for a firewall. The device specification file can define an empty function that returns success in the return format that is required by the APIC. It is not mandatory to support endpoint or network event handling functionality.
