DRAG DROP

Click the Task button.

#### **Answer:**

Explanation:

#### **NEW QUESTION: 2**

Users report that while at work they are unable to access an application from the Internet on their personal mobile devices. The administrator has been asked to determine what could be causing the problem. Which of the following is the BEST area to begin troubleshooting?

- A. Wireless LAN controller
- B. Internet router

- C. DHCP server
  - D. Enterprise firewall
- Answer: D**

**NEW QUESTION: 3**

An Azure AD DS DNS zone is configured in a DNS server. The zone contains records for the managed domain itself. A conditional forwarder is configured in the DNS server to forward queries for records in the managed domain to the configured DNS for that domain. This configuration makes sure that the correct DNS records are returned, as you don't create a local a DNS zone with duplicate records in the managed domain to reflect those resources. To create a conditional forwarder in your managed domain, complete the following steps:

1. Select your DNS zone, such as aaddscontoso.com.
2. Select Conditional Forwarders, then right-select and choose New Conditional Forwarder...
3. Enter your other DNS Domain, such as contoso.com, then enter the IP addresses of the DNS servers for that namespace, as shown in the following example:
4. Check the box for Store this conditional forwarder in Active Directory, and replicate it as follows, then select the option for All DNS servers in this domain, as shown in the following example:
5. To create the conditional forwarder, select OK.

**Answer: A**

Explanation:

An Azure AD DS DNS zone should only contain the zone and records for the managed domain itself. A conditional forwarder is a configuration option in a DNS server that lets you define a DNS domain, such as contoso.com, to forward queries to. Instead of the local DNS server trying to resolve queries for records in that domain, DNS queries are forwarded to the configured DNS for that domain. This configuration makes sure that the correct DNS records are returned, as you don't create a local a DNS zone with duplicate records in the managed domain to reflect those resources. To create a conditional forwarder in your managed domain, complete the following steps:

1. Select your DNS zone, such as aaddscontoso.com.
2. Select Conditional Forwarders, then right-select and choose New Conditional Forwarder...
3. Enter your other DNS Domain, such as contoso.com, then enter the IP addresses of the DNS servers for that namespace, as shown in the following example:
4. Check the box for Store this conditional forwarder in Active Directory, and replicate it as follows, then select the option for All DNS servers in this domain, as shown in the following example:
5. To create the conditional forwarder, select OK.

Name resolution of the resources in other namespaces from VMs connected to the managed domain should now resolve correctly. Queries for the DNS domain configured in the conditional forwarder are passed to the relevant DNS servers.

#### **NEW QUESTION: 4**

Sie planen den Umzug von App1 nach Azure.

Sie erstellen eine Netzwerksicherheitsgruppe (Network Security Group, NSG).

Sie müssen eine Lösung empfehlen, um Benutzern den Zugriff auf App1 zu ermöglichen.

Was solltest du empfehlen?

**A.** Erstellen Sie eine ausgehende Sicherheitsregel für Port 443 aus dem Internet. Ordnen Sie die NSG dem entsprechenden Subnetz zu

enthält die Webserver.

**B.** Erstellen Sie eine eingehende Sicherheitsregel für Port 443 aus dem Internet. Ordnen Sie die NSG allen Subnetzen zu.

**C.** Erstellen Sie eine eingehende Sicherheitsregel für Port 443 aus dem Internet. Ordnen Sie die NSG dem entsprechenden Subnetz zu

enthält die Webserver.

**D.** Erstellen Sie eine ausgehende Sicherheitsregel für Port 443 aus dem Internet. Ordnen Sie die NSG allen Subnetzen zu.

**Answer: C**

Explanation:

As App1 is public-facing we need an incoming security rule, related to the access of the web servers.

Scenario: You have a public-facing application named App1. App1 is comprised of the following three tiers: a SQL database, a web front end, and a processing middle tier.

Each tier is comprised of five virtual machines. Users access the web front end by using HTTPS only.
