NEW QUESTION: 2

You have a database named DB1 that contains two tables. You need to encrypt one column in each table by using the Always Encrypted feature.

The solution must support groupings on encrypted columns. Which two actions should you perform? Each correct answer presents part of the solution.

NOTE: Each correct selection is worth one point.

- A. Encrypt both columns by using deterministic encryption.
- B. Encrypt both columns by using randomized encryption.
- C. Provision a symmetric key by using Transact-SQL.
- D. Provision column master keys and column encryption keys by using Microsoft SQL Server Management Studio (SSMS).

Answer: A,D

Explanation:

A: Use deterministic encryption for columns that will be used as search or grouping parameters, for example a government ID number.

Deterministic encryption always generates the same encrypted value for any given plain text value.

Using deterministic encryption allows point lookups, equality joins, grouping and indexing on encrypted columns.

D: Always Encrypted uses two types of keys: column encryption keys and column master keys. A column encryption key is used to encrypt data in an encrypted column. A column master key is a key-protecting key that encrypts one or more column encryption keys.

NEW QUESTION: 3

DRAG DROP

You work as a network engineer at Your company. Your boss, , is interested attack methodologies. Match the descriptions with the proper methodology. Use only options that apply.

Answer:

Explanation:

Explanation:

NEW QUESTION: 4
