Explanation:

The Systems Development Life Cycle (SDLC), also called the

Software Development Life Cycle or simply the System Life Cycle, is a system development model. There are many variants of the SDLC, but most follow (or are based on) the National Institute of Standards and Technology (NIST) SDLC process. NIST Special Publication 800-14 states: "Security, like other aspects of an IT system, is best managed if planned for throughout the IT system life cycle. There are many models for the IT system life cycle but most contain five basic phases: initiation, development/acquisition, implementation, operation, and disposal." Additional steps are often added, most critically the security plan, which is the first step of any SDLC.

The following overview is summarized from the NIST document, in which the first two steps relate to Risk analysis:

1. Prepare a Security Plan-Ensure that security is considered during all phases of the IT system life cycle, and that security activities are accomplished during each of the phases.
2. Initiation-The need for a system is expressed and the purpose of the system is documented.
3. Conduct a Sensitivity Assessment-Look at the security sensitivity of the system and the information to be processed.
4. Development/Acquisition
5. Implementation
6. Operation/Maintenance

Incorrect Answers:

B: Risk analysis is not a critical part of the Functional Requirements definition.

C: Risk analysis is not a critical part of the System Design Specification.

D: Risk analysis is not a critical part of Development and Implementation.
