You need to use the Python language to build a sampling strategy for the global penalty detection models.

How should you complete the code segment? To answer, select the appropriate options in the answer area.

NOTE: Each correct selection is worth one point.

**Answer:**

Explanation:

Explanation:

Box 1: import torch as deeplearninglib

Box 2: ..DistributedSampler(Sampler)..

DistributedSampler(Sampler):

Sampler that restricts data loading to a subset of the dataset.

It is especially useful in conjunction with

class:`torch.nn.parallel.DistributedDataParallel`. In such

case, each process can pass a DistributedSampler instance as a

DataLoader sampler, and load a subset of the original dataset

that is exclusive to it.

Scenario: Sampling must guarantee mutual and collective

exclusively between local and global segmentation models that

share the same features.

Box 3: optimizer = deeplearninglib.train.

GradientDescentOptimizer(learning\_rate=0.10) Incorrect Answers:

..SGD..

Scenario: All penalty detection models show inference phases

using a Stochastic Gradient Descent (SGD) are running too slow.

Box 4: .. nn.parallel.DistributedDataParallel..

DistributedSampler(Sampler): The sampler that restricts data

loading to a subset of the dataset.

It is especially useful in conjunction with  
:class:`torch.nn.parallel.DistributedDataParallel`.
