- A.** HDInsight Spark cluster
- B.** Azure Stream Analytics
- C.** HDInsight Apache Hadoop cluster using MapReduce
- D.** HDInsight Apache Storm cluster
- E.** Azure SQL Data Warehouse

Answer: D

the second output above, we learned that the OSPF process ID of R3 is 1 and we have to disable the wrong configuration of "area 54 virtual-link 4.4.4.4"):

```
R3>enable
```

```
R3#configure terminal
```

```
R3(config)#ipv6 router ospf 1
```

```
R3(config-rtr)#no area 54 virtual-link 4.4.4.4
```

```
R3(config-rtr)#area 11 virtual-link 2.2.2.2
```

```
Save the configuration:
```

```
R3(config-rtr)#end
```

```
R3#copy running-config startup-config
```

You should check the configuration of R4, too. Make sure to remove the incorrect configuration statements to get the full points.

```
R4(config)#ipv6 router ospf 1
```

```
R4(config-router)#no area 54 virtual-link 3.3.3.3
```

```
R4(config-router)#end
```

After finishing the configuration doesn't forget to ping between R1 and R4 to make sure they work.

Note. If you want to check the routing information, use the show ipv6 route command, not "show ip route".
