**NEW QUESTION: 3**

The Service-Oriented Integration (SOI) architecture can be deployed in a variety of ways. One deployment option is a hierarchical deployment, where each division within the enterprise can deploy the layers of the SOI architecture by using their chosen hardware and software platforms.

A separate enterprise-wide deployment of the upper layers of the architecture is used to provide cross-divisional integration. Which statements are true for this type of hierarchical deployment of SOI?

- A.** Hierarchical deployment of the SOI architecture is a transitional phase moving toward a peer-peer deployment where the enterprise-wide deployment of the upper layers is eliminated.
- B.** Hierarchical deployment of the SOI architecture is the recommended deployment whenever an enterprise has two or more business divisions.
- C.** Hierarchical deployment of the SOI architecture is an anti-pattern and should be avoided due to the additional costs associated with supporting multiple hardware and software platforms.
- D.** Because each division is allowed to select the hardware and software platform, platform vendors will have the complete market for business, which will reduce the costs of hardware and software, thus reducing the cost of technical deployment versus a shared deployment.
- E.** Because each division is allowed to select the hardware and software platform, industry standards become more important to ensure interoperability between the divisions and the enterprise-wide upper layer.
- F.** Hierarchical deployment of the SOI architecture supports acquisitions because each acquisition can be treated as a new division with its own chosen hardware and software platforms.

**Answer: E,F**

Explanation:

Explanation/Reference:

D: This type of deployment easily supports acquisitions since a new acquisition can be treated as simply another portfolio.

E (not F): The primary disadvantage of a hierarchical deployment is the increased cost and complexity of supporting more hardware and software. Adherence to standards to support interoperability is also more important in a hierarchical deployment since the various portfolios may select different
