NEW QUESTION: 1

You have an Azure SQL database named DB1.
You plan to create the following four tables in DB1 by using the following code.

You need to identify which table must be created last.

What should you identify? To answer, select the appropriate options in the answer area.

NOTE: Each correct selection is worth one point.

- A. Table3
- B. Table4
- C. Table1
- D. Table2

Answer: D

Explanation:

Explanation

Table1 references Table4. Therefore Table4 must be created before Table1.

Table2 references Table1 and Table3. Therefore Table1 and Table3 must be created before Table2.

Note: FOREIGN KEY REFERENCES is a constraint that provides referential integrity for the data in the column or columns. FOREIGN KEY constraints require that each value in the column exists in the corresponding referenced column or columns in the referenced table. FOREIGN KEY constraints can reference only columns that are PRIMARY KEY or UNIQUE constraints in the referenced table or columns referenced in a UNIQUE INDEX on the referenced table.

- A. ALL_LOCAL_DRIVES and Shadow Copy Components:\
- B. ALL_LOCAL_DRIVES and System State:\
- C. ALL_LOCAL_DRIVES
- D. ALL_LOCAL_DRIVES and System State:\ and Shadow Copy Components:\

Answer: C

NEW QUESTION: 3

Which AWS EC2 instance type is best suited for a workload that requires high memory and high network throughput? The workload is memory-intensive and requires high network throughput. The instance must be able to handle a large amount of memory and network traffic.

- A. EBS-optimized instance type
- B. EBS-optimized instance type with high memory and high network throughput
- C. EBS-optimized instance type with high memory and high network throughput
- D. EBS-optimized instance type with high memory and high network throughput

Answer: B,C

Explanation:

Explanation

Data stored in Amazon EBS volumes is redundantly stored in multiple physical locations as part of normal operation of those services and at no additional charge. However, Amazon EBS replication is stored within the same availability zone, not across multiple zones; therefore, it is highly recommended that you conduct regular snapshots to Amazon S3 for long-term data durability.

You can use Amazon Data Lifecycle Manager (Amazon DLM) to automate the creation, retention, and deletion of snapshots taken to back up your Amazon EBS volumes.

With lifecycle management, you can be sure that snapshots are cleaned up regularly and keep costs under control.

EBS Lifecycle Policies

A lifecycle policy consists of these core settings:

- * Resource type-The AWS resource managed by the policy, in this case, EBS volumes.

- * Target tag-The tag that must be associated with an EBS volume for it to be managed by the policy.

- * Schedule-Defines how often to create snapshots and the maximum number of snapshots to keep. Snapshot creation starts within an hour of the specified start time. If creating a new snapshot exceeds the maximum number of snapshots to keep for the volume, the oldest snapshot is deleted.

Option C is correct. Each Amazon EBS volume is automatically replicated within its Availability Zone to protect you from component failure, offering high availability and durability. But it does not have an explicit feature like that.

Option D is correct Encryption does not ensure data durability For information on security for Compute Resources, please visit the below URL

<https://d1.awsstatic.com/whitepapers/Security/Security Compute Services Whitepaper.pdf> The correct answers are: Use EBS volume replication. Use EBS volume encryption Submit your Feedback/Queries to our Experts
