NEW QUESTION: 3

Which statement about the overload bit in IS-IS is true?

A. A router setting the overload bit becomes unreachable to all other routers in the IS-IS area.
B. The overload bit in IS-IS is used only for external prefixes.
C. Routers running SPF ignore LSPs with the overload bit set and hence avoid blackholing traffic.
D. The IS-IS adjacencies on the links for which the overload bit is set are brought down.

Answer: C

Explanation:

The OL bit is used to prevent unintentional blackholing of packets in BGP transit networks. Due to the nature of these protocols, IS-IS and OSPF converge must faster than BGP. Thus there is a possibility that while the IGP has converged, IBGP is still learning the routes. In that case if other IBGP routers start sending traffic towards this IBGP router that has not yet completely converged it will start dropping traffic. This is because it isnt yet aware of the complete BGP routes. OL bit comes handy in such situations. When a new IBGP neighbor is added or a router restarts, the ISIS OL bit is set. Since directly connected (including loopbacks) addresses on an "overloaded" router are considered by other routers, IBGP can be bought up and can begin exchanging routes. Other routers will not use this router for transit traffic and will route the packets out through an alternate path. Once BGP has converged, the OL bit is cleared and this router can begin forwarding transit traffic. Reference.

1. Which of the following is a valid IAM policy condition key for S3 bucket policy?

 A. iam:UserSub

 B. s3:bucket

 C. kms:ViaService

 D. s3:bucket

Answer: C

Explanation:

Option A and B are invalid because mapping keys to services cannot be done via either the IAM or bucket policy. Option D is invalid because keys for IAM users cannot be assigned to services. This is mentioned in the AWS Documentation. The kms:ViaService condition key limits use of a customer-managed CMK to requests from particular AWS services. (AWS managed CMKs in your account, such as aws/s3, are always restricted to the AWS service that created them.) For example, you can use kms:ViaService to allow a user to use a customer managed CMK only for requests that Amazon S3 makes on their behalf. Or you can use it to deny the user permission to a CMK when a request on their behalf comes from AWS Lambda.

For more information on key policy's for KMS please visit the following URL:

<https://docs.aws.amazon.com/kms/latest/developerguide/policy-conditions.html> The correct answer is: Use the kms:ViaService condition in the Key policy. Submit your Feedback/Queries to our Experts
