You are developing a Windows Store app. You have the following requirements:

- The app tile must update every 30 minutes.
- Content must be pushed to the app tile from multiple URLs.

You need to schedule the app tile updates. How should you complete the relevant code? (To answer, drag the appropriate code segments to the correct locations in the. Each code segment may be used once, more than once, or not at all. You may need to drag the split bar between panes or scroll to view content.)

1. AddToSchedule(tile);
2. EnableNotificationQueue(true);
3. GetScheduledTileNotifications();
4. StartPeriodicUpdateBatch(pollUris, TileUpdateRecurrence);
5. Update(pollUris);

**Answer:**

Explanation:

A2, B4

**NEW QUESTION: 3**

DRAG DROP

Note: This question is part of a series of questions that use

the same scenario. For your convenience, the scenario is repeated in each question. Each question presents a different goal and answer choices, but the text of the scenario is exactly the same in each question in this series.

You maintain a Microsoft SQL Server instance that contains the following databases SalesDb1, SalesDb2, and SalesDb3. Each database has table named Products and Sales. The following table shows the configuration of each database.

The backup strategies for each database are described in the following table.

Each full or differential backup operation writes into a new file and uses a different sequence number.

You observe the following database corruption issues.

SalesDb3 reports a number of database corruption issues related to error 823 and 824 when reading data pages. You must display the following information about the corrupted pages:

database name

impacted file id

impacted file physical name

impacted page id

event type that identifies the error type

error count

Users report performance issues when they run queries against SalesDb2. You plan to monitor query statistics and execution plans for SalesDb2 by using Query Store. The monitoring strategy must meet the following requirements:

Perform automatic data cleanup when query store disk usage reaches 500 megabyte (MB).

Capture queries based on resource consumption.

Use a stale query threshold value of 60 days.

The query optimizer generates suboptimal execution plans for a number of queries on the Sales table in SalesDb2. You will create a maintenance plan that updates statistics for the table. The plan should only update statistics that were automatically created and have not been updated for 30 days. The update should be based on all data in the table.

You need to write the query the maintenance plan will use to update the statistics.

Which four Transact-SQL segments should you use to develop the solution? To answer, move the appropriate Transact-SQL segments from the list of Transact-SQL segments to the answer area and arrange them in the correct order.

**Answer:**

Explanation:

Step 1: Use SalesDB2...

We specify the specific database SalesDB2, not the master.

Step 2:

Step 3:

From scenario: The plan should only update statistics that were automatically created and have not been updated for 30 days.

Step 4:

Declare the cursor using WITH FULLSCAN.
