NEW QUESTION: 2

Amazon EC2 Spot Instances are a type of EC2 instance that you can purchase at a discounted price. They are designed for flexible, interruptible workloads. Spot instances are available in all AWS Regions and are subject to availability. They are not available for all instance types and are not available for all instance sizes. Spot instances are available for a limited time and are subject to interruption. When a spot instance is interrupted, you can choose to stop the instance or let it terminate. Spot instances are ideal for applications that can tolerate interruption, such as batch processing, data analysis, and machine learning.

- A. Spot instances are available for all instance types and are not available for all instance sizes.
- B. Spot instances are available for a limited time and are subject to interruption.
- C. Spot instances are designed for flexible, interruptible workloads.
- D. Spot instances are subject to availability and are not available in all AWS Regions.

Answer: B

Explanation:

Explanation

The key to understanding spot instances is to look at the way that cloud service providers such as Amazon Web Services (AWS) operate. Cloud service providers invest in hardware resources and then release those resources (often on a per-hour basis) to subscribers. One of the problems with this business model, however, is that at any given time, there are likely to be compute resources that are not being utilized. These resources represent hardware capacity that AWS has paid for but are sitting idle, and not making AWS any money at the moment. Rather than allowing these computing resources to go to waste, AWS offers them at a substantially discounted rate, with the understanding that if someone needs those resources for running a normal EC2 instance, that instance will take priority over spot instances that are using the hardware resources at a discounted rate. In fact, spot instances will be stopped if the resources are needed elsewhere.
