Answer: A

Explanation:

Explanation
An Azure AD DS DNS zone should only contain the zone and records for the managed domain itself.
A conditional forwarder is a configuration option in a DNS server that lets you define a DNS domain, such as contoso.com, to forward queries to. Instead of the local DNS server trying to resolve queries for records in that domain, DNS queries are forwarded to the configured DNS for that domain. This configuration makes sure that the correct DNS records are returned, as you don't create a local a DNS zone with duplicate records in the managed domain to reflect those resources.
To create a conditional forwarder in your managed domain, complete the following steps:
1. Select your DNS zone, such as aaddscontoso.com.
2. Select Conditional Forwarders, then right-select and choose New Conditional Forwarder...
3. Enter your other DNS Domain, such as contoso.com, then enter the IP addresses of the DNS servers for that namespace, as shown in the following example:

4. Check the box for Store this conditional forwarder in Active Directory, and replicate it as follows, then select the option

for All DNS servers in this domain, as shown in the following example:

5. To create the conditional forwarder, select OK. Name resolution of the resources in other namespaces from VMs connected to the managed domain should now resolve correctly. Queries for the DNS domain configured in the conditional forwarder are passed to the relevant DNS servers.

NEW QUESTION: 3

Which two statements are true about the Oracle Direct Network File system (DNFS)?

- A.** Direct NFS is available only in UNIX platforms.
- B.** Oracle Disk Manager can manage NFS on its own, without using the operating kernel NFS driver.
- C.** Direct NFS can load-balance I/O traffic across multiple network adapters.
- D.** It utilizes the OS file system cache.
- E.** A traditional NFS mount is not required when using Direct NFS.

Answer: B,C

Explanation:

E: Performance is improved by load balancing across multiple network interfaces (if available).

Note:

* To enable Direct NFS Client, you must replace the standard Oracle Disk Manager (ODM) library with one that supports Direct NFS Client.

Incorrect:

Not A: Direct NFS Client is capable of performing concurrent direct I/O, which bypasses any operating system level caches and eliminates any operating system write-ordering locks

Not B:

* To use Direct NFS Client, the NFS file systems must first be mounted and available over regular NFS mounts.

* Oracle Direct NFS (dNFS) is an optimized NFS (Network File System) client that provides faster and more scalable access to NFS storage located on NAS storage devices (accessible over TCP/IP).

Not D: Direct NFS is provided as part of the database kernel, and is thus available on all supported database platforms -even those that don't support NFS natively, like Windows.

Note:

* Oracle Direct NFS (dNFS) is an optimized NFS (Network File System) client that provides faster and more scalable access to NFS storage located on NAS storage devices

(accessible over TCP/IP). Direct NFS is built directly into the database kernel - just like ASM which is mainly used when using DAS or SAN storage.

* Oracle Direct NFS (dNFS) is an internal I/O layer that provides faster access to large NFS files than traditional NFS clients.

NEW QUESTION: 4

You work as a Network Administrator for Tech Perfect Inc. The company has offices at different locations of a city. You decide to use 100BaseFX full-duplex Multimode Fiber-optic cabling for interconnecting the offices. What is the maximum length of cable you can use for this network?

- A. 1000 meters
- B. 10 meters
- C. 100 meters
- D. 2000 meters

Answer: D
