NEW QUESTION: 2

A customer has an enterprise data center and wants to deploy two physical hosts with internal disks at each Remote Office/Branch Office location.

* The customer does NOT want to use any external storage arrays.

* There is an existing enterprise SAN and vSphere infrastructure in the centralized data center.

Which VMware technology will fulfill this requirement?

- A. vSAN with two physical hosts and nested witness node on top of them
- B. Virtual Volumes running on a supported SAN
- C. vSAN with two physical hosts and nested witness node placed in the central management location
- D. VMware Storage Appliance with three physical servers

Answer: C

Explanation:

Explanation

(if 1 host fails then it will lose witness as well)

VMware vSAN and VMware Cloud on AWS VMware vSAN aggregates disks that are locally attached to vSphere hosts into a robust, resilient virtual SAN. Workloads placed on the vSAN benefit from per-VM flexible storage policies including failures-to-tolerate, space reservation, disk striping and more.

vSAN redundancy is normally achieved via deployment of three or more physical ESXi servers. Each object stored on vSAN will have a minimum of two data components mirrored across two of the hosts, plus a witness component located on the third host. There are circumstances in which it may be desirable to deploy the vSphere hosts containing VM data in one data center and to maintain a dedicated witness host in an offsite location. This can apply in a vSAN stretched cluster scenario or in a two-node vSAN cluster. Caveats for each of these can be found in the hyperlinks.
