NEW QUESTION: 1

AWS CLI `aws s3 cp s3://bucket/obj.txt local.txt` is used to copy an object from S3 to the local file system.

- A. `aws s3 cp local.txt s3://bucket/obj.txt`
- B. `aws s3 cp s3://bucket/obj.txt local.txt`
- C. `aws s3 cp local.txt s3://bucket/obj.txt --recursive`
- D. `aws s3 cp s3://bucket/obj.txt local.txt --recursive`

Answer: C

NEW QUESTION: 2

How long will a Copy Back operation take when a hot spare is invoked?

- A. Copy Back time depends on the disk capacity
- B. Copy Back time depends on the disk type
- C. Copy Back time depends on the RAID type
- D. Pro-Active hot spare does not use a Copy Back operation

Answer: C

Explanation:

Explanation

Note: Starting with Release 24, you can now use a proactive hot spare for proactive disk replacement. Before Release 24 you had to remove the physical disk to replace in order to force a rebuild. During the rebuild phase, the RAID group was "degraded" and at risk.

Resolution:

Three main benefits of using a proactive hot spare:

Avoiding "uncorrectable errors" due to media problems during the rebuild process.

Greatly reduce the risk of having a degraded RAID group, and the risk of having a double-faulted RAID group.

Performance - a copy to hot spare is faster than a normal rebuild.

Answer: A

Explanation:

Topic 2, Contoso, Ltd

Background

Contoso, Ltd. is developing a patient monitoring solution for a hospital. The solution consists of an Azure website and a set of mobile applications that health care providers use to monitor patients remotely.

Monitoring devices that run the embedded version of Windows will be attached to patients. The devices will collect information from patients and will transmit real-time continuous data to a service that runs on Azure. The service collects and distributes data. The data that the service provides must be accessible by the website and by the mobile applications.

Business Requirements

Patients

All patient data must be stored securely on Azure. Data security must meet or exceed Health Insurance Portability and Accountability Act of 1996 (HIPAA) standards in the United States and must meet or exceed ISO/ICE 27002 data security standards in the rest of the world.

Contractors

Third-party contractors will develop the mobile applications. All contractors must develop the applications by using virtual machines (VMs) that are hosted on Azure. Only authorized contractors and authorized IP addresses are permitted to access the VMs. The contractors can use Near Field Communication (NFC) tags to launch Remote Desktop (RD) connections to the VMs from NFC-enabled devices. For testing purposes, contractors must be able to run multiple instances of mobile applications within the VMs.

Data Collection and Distribution Service

The service must monitor the patient data and send out alerts to health care providers when specific conditions are detected. The service must send the alerts to mobile applications and to the website in real time so that doctors, nurses, and caregivers can attend to the patient. Partner organizations and diagnostic laboratories must be able to securely access the data and the website from remote locations.

Current Issues

A partner that is testing a prototype of the website reports that after signing in to the website, the partner is redirected to the settings page instead of to the home page. The data from the patient devices is slow to appear on the website and does not always appear. All patient devices online have active connections to the data collection service.

Technical Requirements

Contractors

All contractors will use virtual machines that are initially

configured as size A3. Contractors must sign in to the assigned VM by using IP addresses from a list of preapproved addresses.
Data Collection and Distribution Service

The service runs Node.js in a worker role.

The service must use at least 2048-bit encryption and must use port 8888.

All patient information must be encrypted and stored by using a NoSQL data store.

Data must be stored and retrieved securely by using RESTful endpoints.

Data must NOT be stored within a virtual machine.

All deployed services must send an alert email to

[\[email#160;protected\]](#) when any of the following conditions is met:

The CPU Percentage metric is at or above 85 percent for at least 10 minutes.

The Network In metric is at or above 2 KB for at least 10 minutes.

The Network Out metric is at or above 2 KB for at least 10 minutes.

The Disk Write metric is at or above 1 KB/sec for at least 30 minutes.

The Disk Read metric is at or above 1 KB/sec for at least 30 minutes.

Website and Mobile Devices

The website must be secure and must be accessible only within the hospital's physical grounds. All mobile applications and websites must be responsive. All websites must produce error logs that can be viewed remotely.

Virtual Machines

All Azure instances must be deployed and tested on staging instances before they

--

are deployed to production instances.

All deployed instances must scale up to the next available CPU instance at a CPU

usage threshold of 90 percent and scale down when the usage is below 10

percent.

Application Structure

Relevant portions of the application files are shown in the following code segments. Line numbers in the code segments are included for reference only and include a two-character prefix that denotes the specific file to which they belong.
