#### **NEW QUESTION: 1**

An application allows users at a company's headquarters to access product data.

The product data is stored in an Amazon RDS MySQL DB instance. The operations team has isolated an application performance slowdown and wants to separate read traffic from write traffic. A solutions architect needs to optimize the application's performance quickly.

What should the solutions architect recommend?

**A.** Create read replicas for the database.

Configure the read replicas with half of the compute and

storage resources as the source database.

**B.** Create read replicas for the database.

Configure the read replicas with the same compute and storage resources as the source database.

**C.** Change the existing database to a Multi-AZ deployment.

Serve the read requests from the primary Availability Zone.

**D.** Change the existing database to a Multi-AZ deployment.

Serve the read requests from the secondary Availability Zone.

**Answer: B**

Explanation:

**NEW QUESTION: 2**

Amazon ElastiCache for Redis is configured to use a Multi-AZ deployment. A primary Availability Zone is used to serve read requests. The primary Availability Zone is currently experiencing a hardware issue. What should you do to ensure that the database remains available and that read requests are served from the secondary Availability Zone?

**A.** Live

Switch the primary Availability Zone to the secondary Availability Zone. This will automatically failover to the secondary Availability Zone.

**B.**

Manually failover to the secondary Availability Zone. This will automatically failover to the secondary Availability Zone.

**C.**

Change the database to a Multi-AZ deployment. This will automatically failover to the secondary Availability Zone.

**D.**

Change the database to a Multi-AZ deployment. This will automatically failover to the secondary Availability Zone.

**Answer: B**

**NEW QUESTION: 3**

A company has a database on Amazon ElastiCache for Redis. The database is currently using a Multi-AZ deployment. The primary Availability Zone is currently experiencing a hardware issue. What should you do to ensure that the database remains available and that read requests are served from the secondary Availability Zone?

**A.**

Manually failover to the secondary Availability Zone. This will automatically failover to the secondary Availability Zone.

**B.**

Change the database to a Multi-AZ deployment. This will automatically failover to the secondary Availability Zone.
