**NEW QUESTION: 4**

Which three statements about HSRP operation are true? (Choose three.)

- A. The HSRP default timers are a 3 second hello interval and a 10 second dead interval.
- B. HSRP supports up to 255 groups per interface, enabling an administrative form of load balancing.
- C. The HSRP virtual IP address must be the same as one of the router's interface addresses on the LAN.
- D. The virtual IP address and virtual MAC address are active on the HSRP Master router.
- E. HSRP supports only clear-text authentication.
- F. The HSRP virtual IP address must be on a different subnet than the routers' interfaces on the same LAN.

**Answer: A,B,C**

#### Explanation:

The virtual MAC address of HSRP version 1 is 0000.0C07.ACxx, where xx is the HSRP group number in hexadecimal based on the respective interface. For example, HSRP group 10 uses the HSRP virtual MAC address of 0000.0C07.AC0A. HSRP version 2 uses a virtual MAC address of

0000.0C9F.FXXX (XXX: HSRP group in hexadecimal)

All routers in a HSRP group send hello packets. By default, the hello timer is set to 3 seconds and the dead interval is 10 seconds. The range for HSRP version 1 is from 0 to 255. The range is for HSRP version 2 is from 0 to 4095. The default value is 0. For this question, it is assumed that Cisco is referring to HSRP version 1 as the other options are not correct.
