Answer:

Explanation:

- Change the speed and duplex settings on AP2 only to 100 and full.
- Change the mode to G on AP2
- Change the channel to 6 on AP2

Explanation:

Since we know that the network was running perfectly before replacing AP2 we should start by looking at this new device that was used to replace the old one. Here we see that the other AP's have hard coded the speed and duplex settings to 100/full, while AP2 is set to auto/auto.

Also, the other AP's have been configured to use 802.11G, while AP2 is using 802.11B.

Finally the channel that AP2 is using overlaps with AP1 which can cause problems.

Channels 1, 6, and 11 are spaced far enough apart that they don't overlap.

On a non-MIMO setup (i.e. 802.11 a, b, or g) you should always try to use channel 1, 6, or 11.

Since AP1 is using 1, and AP3 is using 11, AP2 should be using 6.
