NEW QUESTION: 3

Answer:

Explanation:

Explanation

* Use the switch statement to select one of many blocks of code to be executed.

Syntax

```
switch(expression) {
```

```
case n:
```

```
code block
```

```
break;
```

```
case n:
```

```
code block
break;
default:
default code block
}
```

This is how it works:

The switch expression is evaluated once.

The value of the expression is compared with the values of each case.

If there is a match, the associated block of code is executed.

* `Object.prototype.constructor`

Returns a reference to the Object function that created the instance's prototype. Note that the value of this property is a reference to the function itself, not a string containing the function's name. The value is only read-only for primitive values such as 1, true and "test".

* Description

All objects inherit a constructor property from their prototype:

```
var o = {};
```

```
o.constructor === Object; // true
```

```
var a = [];
```

```
a.constructor === Array; // true
```

```
var n = new Number(3);
```

```
n.constructor === Number; // true
```

* The constructor property is created together with the function as a single property of `func.prototype`.

Reference: JavaScript Switch

```
Statement;Object.prototype.constructor
