Answer: C

Explanation:

Explanation

<https://cloud.google.com/docs/enterprise/best-practices-for-enterprise-organizations> Google Cloud Dedicated Interconnect provides direct physical connections and RFC 1918 communication between your on-premises network and Google's network.

Dedicated Interconnect enables you to transfer large amounts of data between networks, which can be more cost effective than purchasing additional bandwidth over the public Internet or using VPN tunnels.

Benefits:

* Traffic between your on-premises network and your VPC network doesn't traverse the public Internet.

Traffic traverses a dedicated connection with fewer hops, meaning there are less points of failure where traffic might get dropped or disrupted.

* Your VPC network's internal (RFC 1918) IP addresses are directly accessible from your on-premises network. You don't need to use a NAT device or VPN tunnel to reach internal IP addresses. Currently, you can only reach internal IP addresses over a dedicated connection. To reach Google external IP addresses, you must use a separate connection.

* You can scale your connection to Google based on your needs. Connection capacity is delivered over one or more 10 Gbps Ethernet connections, with a maximum of eight connections (80 Gbps total per interconnect).

* The cost of egress traffic from your VPC network to your on-premises network is reduced. A dedicated connection is generally the least expensive method if you have a high-volume of traffic to and from Google's network.

NEW QUESTION: 2

A technician is installing a webcam in a nursery for a user to monitor their baby. The user wants to ensure that the webcam is not broadcasting externally. Which of the following would the technician implement on the SOHO router to prevent the broadcast?

A. Block the outbound port

- B. Enable static IPs
- C. Enable MAC filtering
- D. Change the default SSID

Answer: A

Explanation:

NEW QUESTION: 3

DRAG DROP

Your network contains two Active Directory forests named contoso.com and adatum.com. All domain controllers run Windows Server 2012 R2.

A federated trust exists between adatum.com and contoso.com. The trust provides adatum.com users with access to contoso.com resources.

You need to configure Active Directory Federation Services (AD FS) claim rules for the federated trust.

The solution must meet the following requirements:

In contoso.com, replace an incoming claim type named Group with an outgoing claim type named Role.

In adatum.com, allow users to receive their tokens for the relying party by using their Active Directory

group membership as the claim type.

The AD FS claim rules must use predefined templates.

Which rule types should you configure on each side of the federated trust?

To answer, drag the appropriate rule types to the correct location or locations. Each rule type may be used once, more than once, or not at all. You may need to drag the split bar between panes or scroll to view content.

Select and Place:

Answer:

Explanation:

Explanation/Reference:

* Acceptance transform rule set

A set of claim rules that you use on a particular claims provider trust to specify the incoming claims that will be accepted from the claims provider organization and the outgoing claims that will be sent to the relying party trust.

Used on: Claims provider trusts

* Issuance Authorization Rule Set

A set of claim rules that you use on a relying party trust to specify the claims that will be issued to the relying party.

Used on: Relying party trusts

NEW QUESTION: 4

Choose three correct statements about ASM disk group attributes set from the ASMCA Create Disk Group

- A. The Database Compatibility field (compatible.rdbms) sets the minimum version level for any database instance that is allowed to mount the disk group.
- B. When creating a disk group with ASMCA, the default setting for the ASM Compatibility field (compatible.asm) is 10.1.
- C. Advancing the values for disk group compatibility attributes can be reversed if desired.
- D. To use ADVM volumes, ADVM Compatibility (compatible.advm) must be set to 11.2.0 or later and ASM Compatibility must be 11.2.0 or later.
- E. The field labeled ASM Compatibility sets the compatible.asm attribute.

Answer: A,D,E

Explanation:

Explanation/Reference:

Explanation:

COMPATIBLE.ASM

The value for the disk group COMPATIBLE.ASM attribute determines the minimum software version for an Oracle ASM instance that can use the disk group.

COMPATIBLE.RDBMS

The value for the disk group COMPATIBLE.RDBMS attribute determines the minimum COMPATIBLE database initialization parameter setting for any database instance that is allowed to use the disk group.

COMPATIBLE.ADVM

The value for the disk group COMPATIBLE.ADVM attribute determines whether the disk group can contain Oracle ASM volumes. The value must be set to 11.2 or higher.

Before setting this attribute, the COMPATIBLE.ASM value must be 11.2 or higher. The default disk group compatibility settings are 11.2 for Oracle ASM compatibility, 10.1 for database compatibility, and no value for Oracle ADVM compatibility. The disk group compatibility settings can only be advanced; you cannot revert to a lower compatibility setting.
