NEW QUESTION: 3

Which of the following statements are true regarding the function of the LAP in the Cisco Unified Wireless Network architecture? (Choose three.)

- A. The LAP maintains associations with client computers.
- B. The LAP supports 802.11 encryption.
- C. The LAP determines which RF channel should be used to transmit 802.11 frames.
- D. The LAP should be connected to an access port on a switch.
- E. The LAP can function without a WLC.
- F. The LAP must be located on the same subnet as a WLC.

Answer: A,B,D

Section: Considerations for Expanding an Existing Network

Explanation

Explanation:

In the Cisco Unified Wireless Network architecture, a lightweight access point (LAP) supports 802.11 encryption, maintains associations with client computers, and should be connected to an access port on a switch. A LAP creates a Lightweight Access Point Protocol (LWAPP) tunnel between itself and a wireless LAN controller (WLC)? in LWAPP operations, both a LAP and a WLC are required. The WLC handles many of the management functions for the link, such as user authentication and security policy management, while the LAP handles real-time operations, such as sending and receiving 802.11 frames, wireless encryption, access point (AP) beacons, and probe messages.

When connecting a LAP to a network, you should connect the LAP to an access port on a switch, not to a trunk port. Because the WLC handles the management functions for LWAPP operations, the LAP cannot begin associating with client computers unless a WLC is available on the network. Therefore, the LAP must associate with a WLC after it is connected to the network. After connecting to a WLC and obtaining its configuration

information, the LAP can begin associating with clients. The LAP can receive encrypted or unencrypted 802.11 frames. The WLC, however, does not support 802.11 encryption; as the data passes through the LAP, it is decrypted and then sent to the WLC for further forwarding.

It is not necessary for the LAP to be located on the same subnet or even in the same geographic area as a WLC. As long as a WLC is available on the network and the LAP is configured with the address of the WLC, the LAP will be able to connect to the WLC. DHCP option 43 can be used to automatically configure a LAP with the IP address of one or more WLCs, even if those WLCs reside on a different IP subnet.

A LAP requires a WLC in order to function. If the WLC becomes unavailable, the LAP will reboot and drop all client associations until the WLC becomes available or until another WLC is found on the network.

The WLC, not the LAP, determines which radio frequency (RF) channel should be used to transmit 802.11 frames in LWAPP operations. The WLC is responsible for selecting the RF channel to use, determining the output power for each LAP, authenticating users, managing security policies, and determining the least used LAP to associate with clients.
