NEW QUESTION: 1

What is the Overlay Transport Virtualization site VLAN used for?

- A.** to detect devices at the site that are not capable of OTV
- B.** to allow the join interfaces at different sites to communicate
- C.** to allow multiple site AEDs to communicate with each other
- D.** to facilitate communications between OTV edge devices within the site

Answer: A

Explanation:

The edge device performs OTV functions: it receives the Layer 2 traffic for all VLANs that need to be extended to remote locations and dynamically encapsulates the Ethernet frames into IP packets that are then sent across the transport infrastructure. It is expected that at least two OTV edge devices are deployed at each data center site to improve the resiliency.
